

Professional Summary / About Me – Extended Version

I am a young tech innovator passionate about sustainability, artificial intelligence, and intelligent system design. As the founder of EcoFlux and Plastidiesel, I have developed projects that combine hardware and software to transform waste into energy and create decentralized, resilient systems for communities.

My experience spans programming in Python, web development, and AI-assisted modeling, alongside active participation in mathematics and logic competitions such as RFO, Kangaroo Math Olympiad, and Lütfti Zade Olympiads, which strengthened my analytical thinking and problem-solving skills.

I am motivated by real-world challenges and aim to develop scalable technologies that not only solve environmental problems but also create practical impact in energy management and sustainability. My goal is to continue innovating, building, and learning, bridging the gap between creative ideas and tangible solutions.
